

# New insights brought by broadband seismic data on the Brazil-Angola conjugate margins

*Gregor Duval\*, Jaswinder Mann, Lauren Houston and Steven Bowman*

# Content

---

- Introductory remarks: why does the seismic interpreter need broadband data?
- Seismic surveys location (South Atlantic margin equivalence) and acquisition parameters
- Pre-salt exploration and broadband seismic imaging
- Post-salt broadband seismic benefits: facies mapping and reservoir characterisation

# Why does the seismic interpreter need broadband data?

# Effects and benefits of increasing the bandwidth

**10-20Hz**

**Large side-lobes and broad central peak**

**10-25Hz**

**10-30Hz**

**10-35Hz**

**Sharper central peak**

**Increasing high frequencies**

**Increase low frequencies**

**10-20Hz**

**5-20Hz**

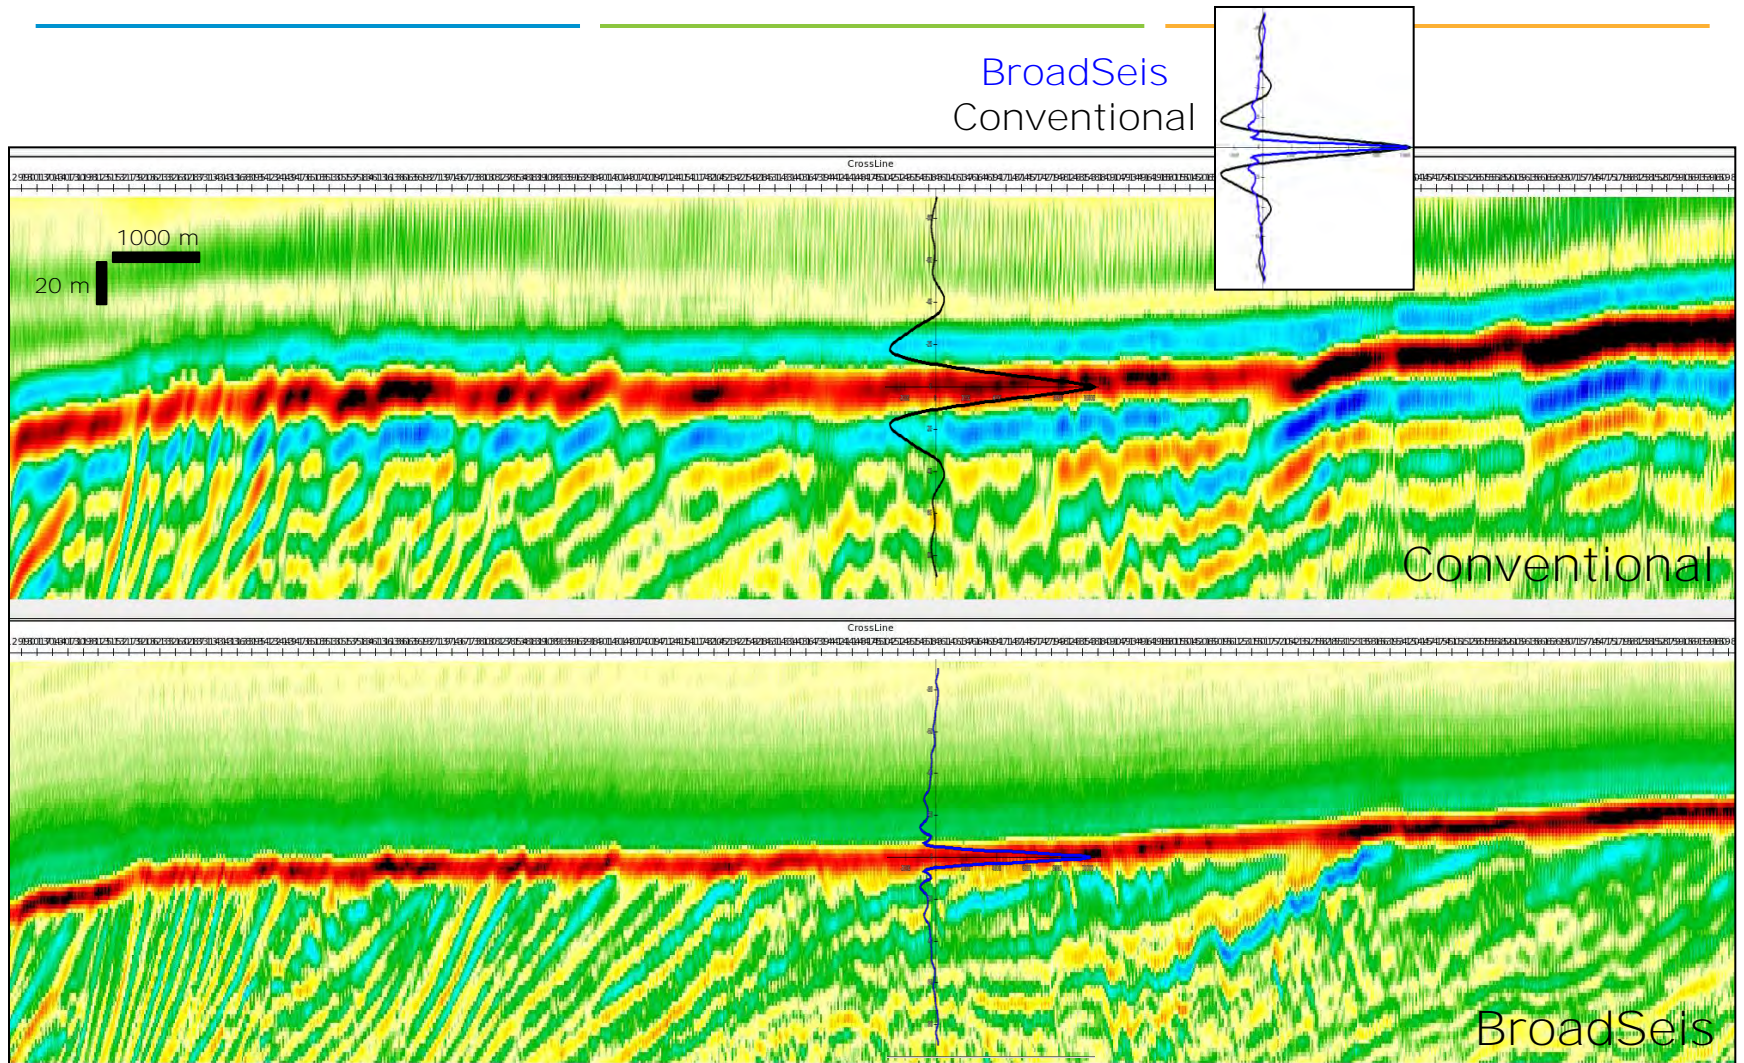

**2-20Hz**

**Reduced side-lobes**

- Total area covered = 13,760km<sup>2</sup>
- Streamer spread = 8000m x 10, 8100m x 12
- BroadSeis streamer profile = 10m to 50m
- Streamer separation = 100m
- Shot-point interval = 25m
- Record length = 10sec
- PreSDM algorithm = **Kirchhoff**, AP-CBM and RTM
- Max depth output 10km

# Angola Kwanza Basin - Broadband 3D surveys

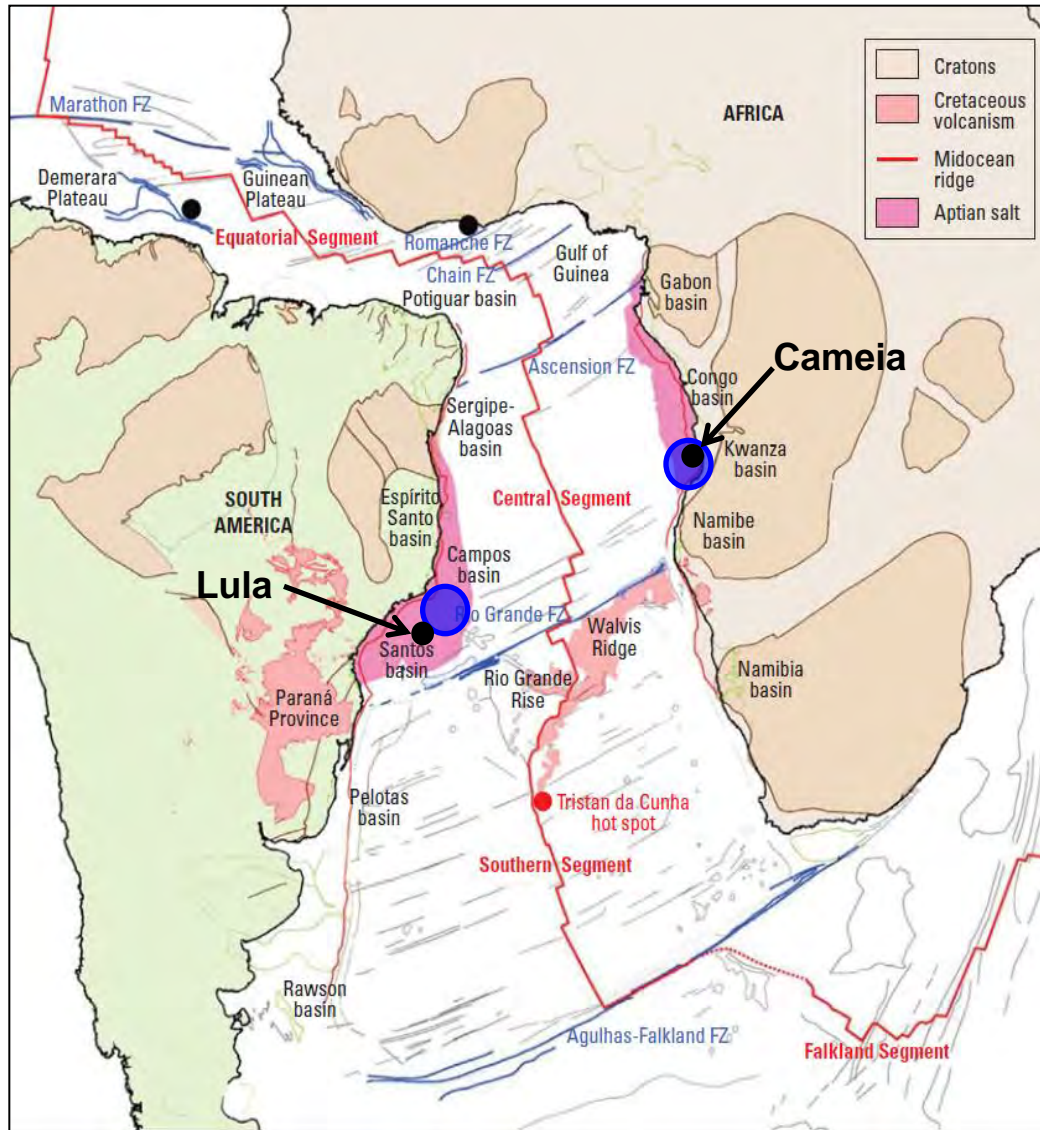

# Angola Kwanza Basin – Broadband 3D surveys

Parameter	Block 21 survey	Block 22 survey
Total area	4,300km <sup>2</sup>	2,915km <sup>2</sup>
Streamer length	8100m	8100m
Number of streamers	12	12
BroadSeis streamer profile	8-50m	10-50m
Streamer separation	100m	100m
Shot-point interval	25m	25m
Record length	10sec	9sec
PreSDM algorithm	<b>CBM (fast-track)</b> Kirchhoff (final)	<b>CBM</b> and Kirchhoff
Max depth output	12km	10km

Broadband

# Building the initial Vp model with broadband data

# Remarks

---

## Constant Depth Streamer

## Variable Depth Streamer

VS.

Broadband data very useful for:

- Quick look, uncalibrated inversion techniques
- Use of seismic inversion in frontier areas (no well data)

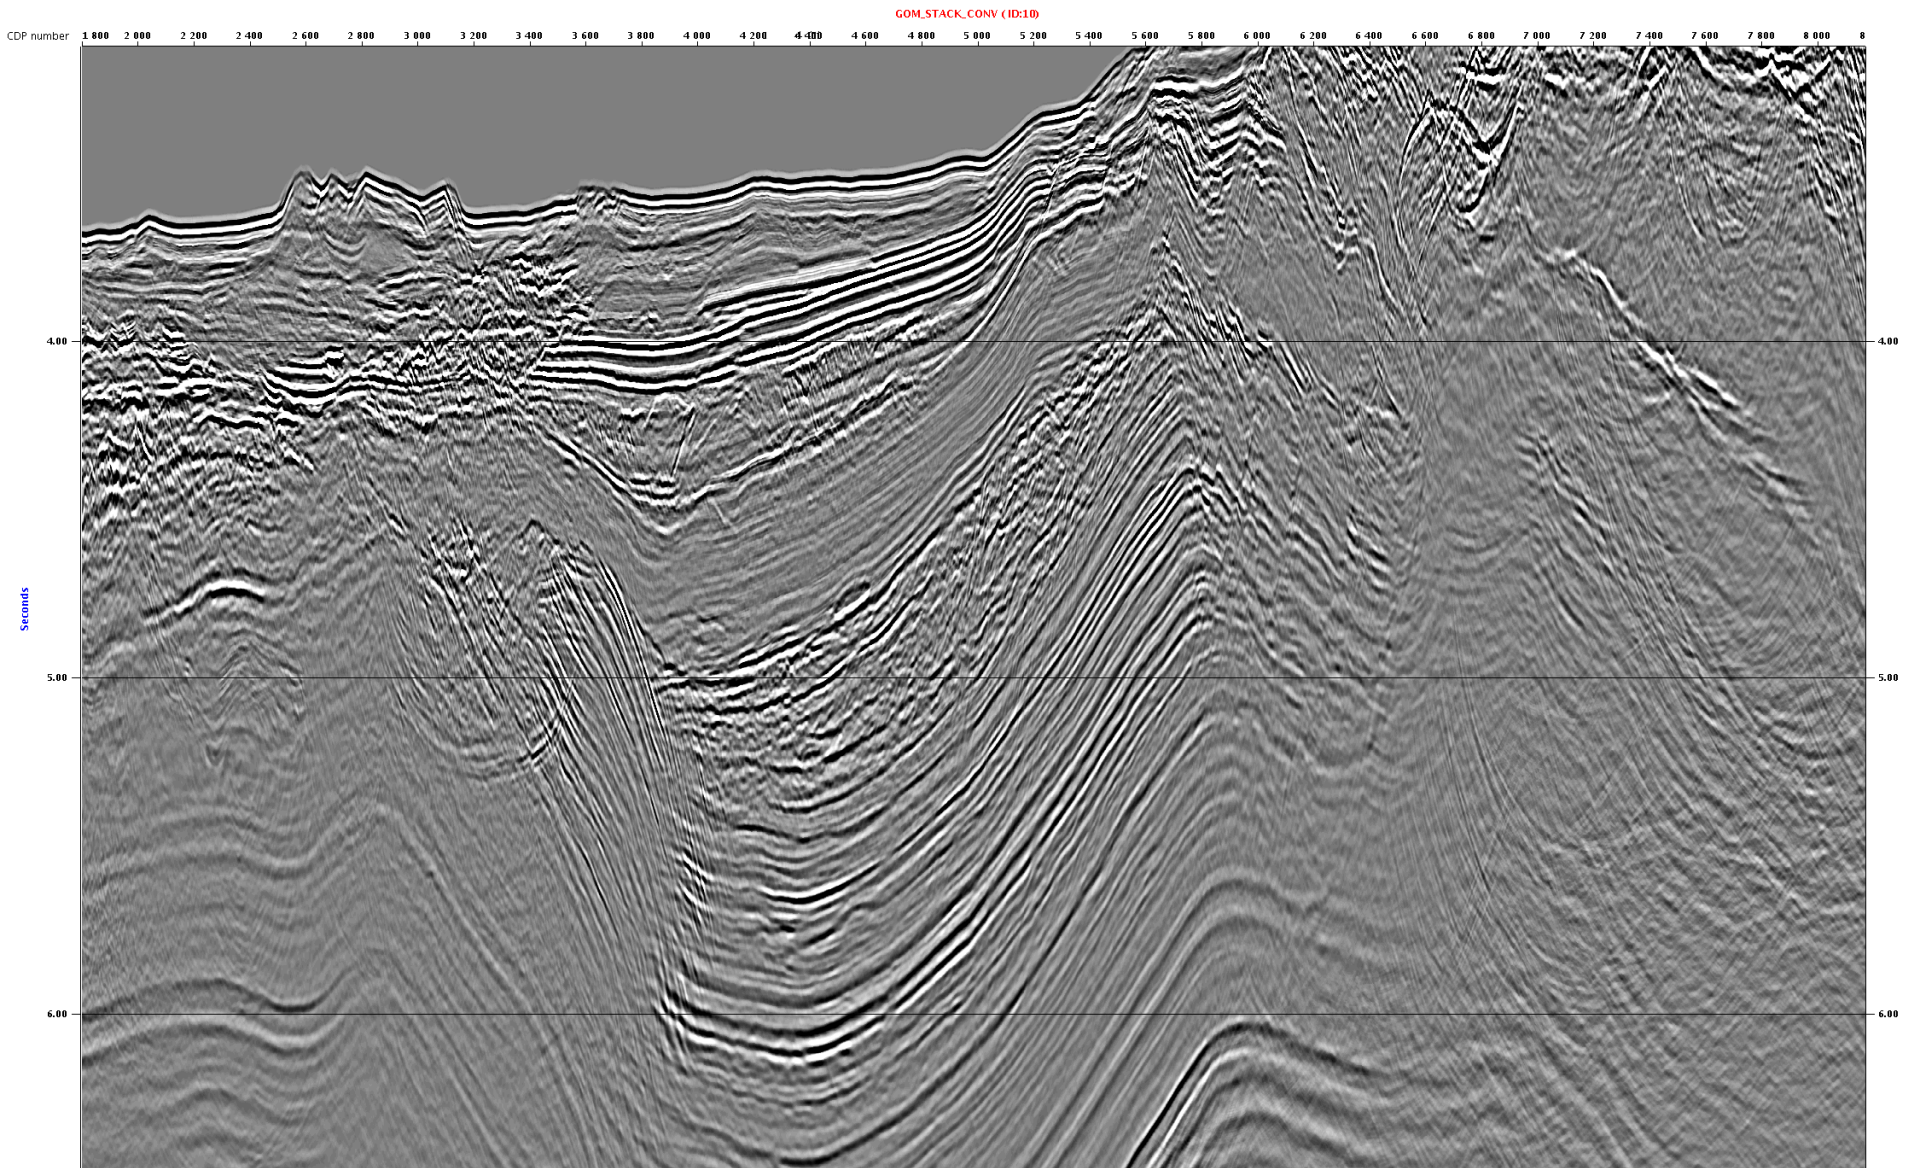

# Angola Kwanza Basin – Sub-salt imaging

# Gulf of Mexico analogy – Conventional data

# Gulf of Mexico analogy – Broadband data

# Angola Kwanza Basin – Broadband PSTM

*BroadSeis would give more high frequencies, as high as 250Hz, for sharp imaging of faults and small scale features*

# Angola Kwanza Basin - Frequency decomposition

Time slice at 2844ms

2.5Hz

5.2Hz

11.5Hz

Gas cloud?

# Angola Kwanza Basin – Broadband PSTM

*BroadSeis would give more high frequencies, as high as 250Hz, for sharp imaging of faults and small scale features*

# Angola Kwanza Basin – Frequency decomposition

Frequency decomposition of broadband data and volume blend

*The full range of frequencies offered by BroadSeis allows for highly detailed facies and structural mapping*

# Angola Kwanza Basin – Frequency decomposition

---

# Conclusions

---

- Broadband seismic data gives the following benefits on the South Atlantic Margins
  - Overall genuine formation signature: no side-lobes and sharper central peak
  - Strong basis for reservoir characterisation and pre-stack seismic inversion
  - Low frequencies penetrate deeper to help imaging trough salt bodies and interpret deep syn-rift fault blocks to better understand sub-salt plays
  - High frequencies allow for high resolution shallow imaging and subtle facies variations in the post-salt turbidite plays
